

TransPort  
Training  
Program

## TT012 – TransPort behaviour customisation by Python

How to customise the behaviour of Digi  
TransPort routers using Python.

# Low Level Vs High Level Programming Languages

- Which of you has ever written a program or script?
- Assembler – extremely low level
- C++ very low level. Compiled code is platform specific.
- Java – higher – compiled “byte code” can run on multiple operating systems.
- VB.net very high – runs on Windows only
- Python – very high
  - Huge number of library resources
  - Automatic memory management
  - Normally interpreted but with the option to compile
  - Platform independent compiled code can run on multiple operating systems
  - Small amount of code can achieve a lot. Normally many more lines of code needed to achieve the same result in C.
  - Object Oriented kind of, its optional.
  - Multi-threaded

How many of you have done any programming ?  
You're favourite languages are ?

- Open-source, flexible language that puts decision-making intelligence on the router under end user control.
- Very simply to write basic code
- Easy to experiment interactively
- Powerful extensions
- Broad support
- Less to type, less to debug, less to maintain
- It's named after Monty Python's Flying Circus

It's named Python after Monty Python's Flying Circus! And the official IDE is named IDLE after Eric Idle

# Lots of resources

- Online
  - Python.org (<http://docs.python.org>)
  - Dive Into Python (<http://diveintopython.org>)
  - Python Challenge (<http://www.pythonchallenge.com>)
- Books
  - Learning Python by Mark Lutz
  - Programming Python by Mark Lutz
  - Python Cookbook by Alex Martelli, Anna Martelli Ravenscroft, David Ascher

# A basic program

```
def hello():  
    """Prints a salutation to the user"""  
    # Say hello  
    print "Hello World!"  
  
if __name__ == "__main__":  
    hello()
```

Note that indentation dictates structure, not keywords or special tokens.

# A Really Basic Program

```
print "Hello World!"
```

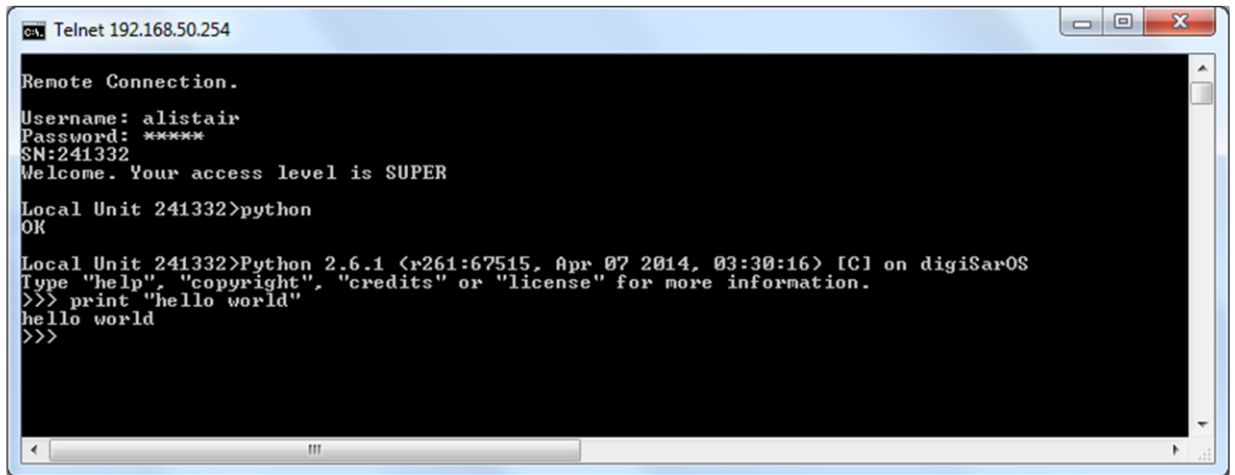

# Indentation Matters

```
if 1+1==2:  
    print "answer correct!"  
    print "you did maths!"
```

```
if 1+1==3:  
    print "answer correct"  
print "you did maths!"
```

Explain the output of the above programs

# Interactive Interpreter

```
CA: Telnet 192.168.50.254
Remote Connection.

Welcome. Your access level is SUPER
Local Unit 241332>python
OK
Local Unit 241332>Python 2.6.1 (<#261:67515, Apr 07 2014, 03:30:16> [C] on digiSarOS
Type "help", "copyright", "credits" or "license" for more information.
>>> print "hello world"
hello world
>>>
```

Really cool for checking syntax and debugging.

# Core Data Types

- Numbers
- Strings
- Lists
- Dictionaries
- Tuples
- Files

# Data types – Scalars

- Numbers
  - Three types (int, float and long)
  - Varying representations (10, 0xa, 012)
  - Don't worry too much about type (except division)
  - $5 / 2 = 2$
  - $5.0 / 2 = 2.5$
- bool
  - Values ( True and False )
- None

# Strings

- Normal – "Hello\nThere" (allows escapes)  
Triple-quoted (preserves entered text)  
""Hello  
There""
- Raw – r"Hello\nThere" (escapes ignored)
- Unicode – u"\u0496"(inserts Ж)  
– Allows unicode escapes, creates unicode strings, a different type

# dir shows available attributes

'_strip_', '_swapcase_', '_title_', '_translate_', '_upper_', '_zfill']
>>>
```

# Conditional Execution

```
if <expr>:
```

```
    <...>
```

```
elif <expr>:    There is no goto or case statement in Python
```

```
    <...>
```

```
else <expr>:
```

```
    <...>
```

# Loops

```
for <var> in <sequence>:  
    <...>
```

```
while <expr>:  
    <...>
```

## Variations:

- *break* and *continue* affect looping
- *pass* can act as a placeholder
- *(x)range(i[, j[, k]])* is extremely useful for *for* statements

# Function

- Functions organize your code and minimise redundancy
- Function blocks begin with the keyword def followed by the function name and parentheses ()
- Any input parameters (arguments) should be inserted into the parentheses
- Functions can optionally return one or more results (comma separated)

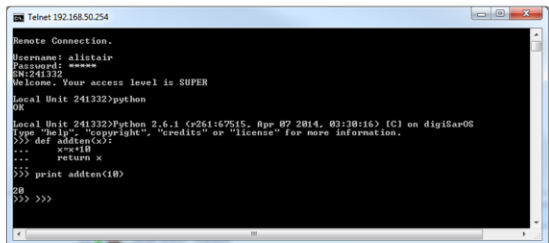

Function Declaration:

```
def addten(x):  
    """This function adds 10 to supplied argument"""  
    x = x +10  
    return x
```

Function Call:

```
print addten(10)
```

Demo:

```

# Modules

We already have seen one

```
# hello.py
def hello():
    """Prints a salutation to the user"""
    # Say hello
    print "Hello World!"

if __name__ == "__main__":
    hello()
```

```
import hello
hello.hello()
```

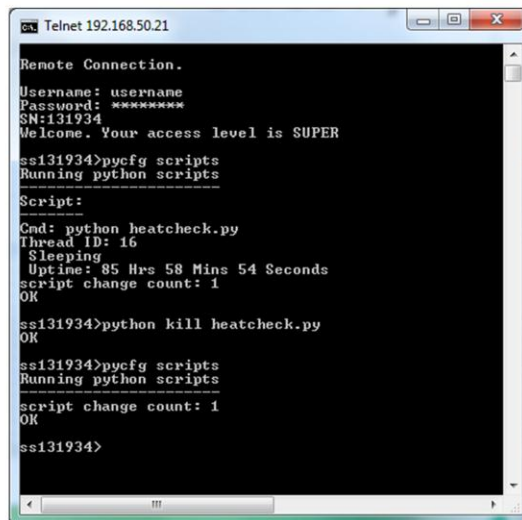

# Threading

## To run a Python program

- Write the program and save as a text file  
“filename.py”
- Use an FTP client to FTP it to the root folder via the TransPort routers built in FTP server
- Execute the program from the CLI (e.g. telnet or SSH)  
“python filename.py”

# SarOS Python Commands

- pycfg scripts
  - View running scripts
- python kill filename.py
  - Terminate a named python script
- python kill all
  - Terminate all running python scripts
- cmd <n> autocmd “python filename.py”
  - configure a Python program to run automatically on start up

```
Telnet 192.168.50.21
Remote Connection.

# Customisation by Python

- SAROS is very configurable and has a huge amount of flexibility built in. Flexibility is further increased by the Python scripting language.
- The behaviour of the router can be quite easily customised by Python.
- One “trick” is to find the CLI command to do what you need. E.g. if you want to send an email use the SarOS “email” command instead of trying to use a Python SMTP library.
- Typical simple customisation: monitor the status of something, and based on that change the configuration on the fly – or generate an event etc
- The Python Version is 2.6.1

# Some Simple Real Customisations

- Check for MAC addresses of all clients that connect to WiFi Access Point and send to server via TCP.
- Python Web Server running completely custom pages which are capable of changing router's configuration.
- Check available cellular networks (dual SIM) on start-up. Make choice based upon signal strength, ping test, radio technology.
- Control LEDs on front panel based on status of VPN tunnel
- Receive SMS messages and send data out of serial port
- Log GPS information and Wi-Fi/cellular status to USB FLASH drive
- Interact programmatically with T1/T2 cards
- CCTV – turn on lights after PIR detection
- Roaming SIM network support – check through all networks available to a roaming SIM card and make the selection based upon prioritisation rules and tests.

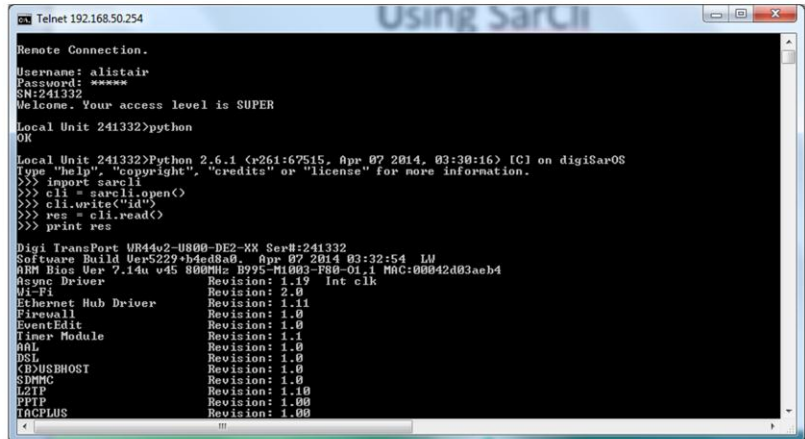

# Import the sarcli module

It's amazing what can be achieved by issuing CLI commands.

```
import sarcli

cli = sarcli.open()
cli.write("id")
res = cli.read()
print res
cli.close()
```

Demo

The screenshot shows a Telnet window titled "Using SarCli" connected to 192.168.50.254. The user 'alistair' logs in with password '\*\*\*\*\*' and receives a 'Welcome' message. The user enters 'python' at the prompt, which leads to a Python shell. In the shell, the user imports 'sarcli', opens a CLI session, writes 'id', reads the response, and prints it. The output is a list of hardware components and their revision numbers.

```

# Other Built in Modules

From the interactive interpreter:

```
>>>help()
help> modules
```

This will list all the Python modules available in SarOS !

User can add more modules:

- 1) FTP zip file with modules onto router's root folder
- 2) Import it into Python code:

```
>>>import sys
>>> sys.path.insert(0,'paramiko.zip')
>>>import paramiko.sftp
```

# Useful SarOS commands for scripts

- Send an email
  - `email "EMAIL <TO> <FROM> <SUBJECT> <TEMPLATE> [ATTACHMENT LIST]"`
- Send an SMS
  - `sendsms "SENDSMS <dest> <message>"`
- Create an event
  - `setevent "SETEVENT <text> [<priority> [trapcode]]"`
    - Can trigger SMS
    - Can trigger email
    - Can trigger SNMP trap
    - Can trigger SYSLOG event
- Flash the LEDs
  - `flashleds`
- Take full control of the LEDs under software control
  - `ledbnk LEDBNK <led> <bank> [?]`
  - `ledn LEDN <led> <bank> [<state>]`

# Digi Python Modules

- sarcli
  - Interact with the Digi TransPort Command Line Interface
- digicanbus
  - Use with the fleet daughter card Interfaces J1708, CAN bus /J1939
  - See [http://ftp1.digi.com/support/documentation/AN\\_49\\_Digi\\_TransPort\\_Fleet\\_card.pdf](http://ftp1.digi.com/support/documentation/AN_49_Digi_TransPort_Fleet_card.pdf)
- digihw
  - Interact with telemetry cards, GPS and WR44 DIO
  - See [http://ftp1.digi.com/support/documentation/AN\\_49\\_Digi\\_TransPort\\_Fleet\\_card.pdf](http://ftp1.digi.com/support/documentation/AN_49_Digi_TransPort_Fleet_card.pdf)
- digisms
  - Receive SMS messages in Python scripts
  - <http://www.digi.com/wiki/developer/index.php/Module:digisms>
- digiweb
  - Use the built in SarOS web server to display content

# HOPS I

1. Write a small script to flash the LEDs or use the example below to print out SMS messages
2. FTP the script to your router
3. Execute the script from the command line
4. Configure the script to autostart and reboot

```
import sys, digisms, time

# Test script to receive SMS messages
# Note also that a script will only get the SMS if it
# matches the callerid list in modemcc

def smscb(SMSMessage):
    print "sms source: %s" % SMSMessage["source_addr"]
    print "sms message: %s" % SMSMessage["message"]

if __name__ == '__main__':
    h = digisms.Callback(smscb)
    while 1:
        time.sleep(1)
```
